
SIGNALS AND SYSTEMS

MR. ANKUR JYOTI SARMAH

ASSISTANT PROF., DEPT. OF ELECTRONICS & TELECOM. ENGG.

ASSAM ENGINEERING COLLEGE

- 1) Signals and systems → Marks
- 2) Semiconductor device → Backbone
- 3) Digital circuits
- 4) Network theory
- 5) Marks

Low pass filter → high freq. signal

High pass filter

Voice signal → low freq. signals.

Energy → freq.

$$E = h\nu$$

Ex ~~can~~ end \rightarrow Noise \rightarrow high freq.
 \downarrow
unwanted signal present in our msg (voice)

It allows
LPF \rightarrow low freq. signals and cut off all higher freq.

$20\text{kHz} \rightarrow 20\text{kHz}$
 500Hz

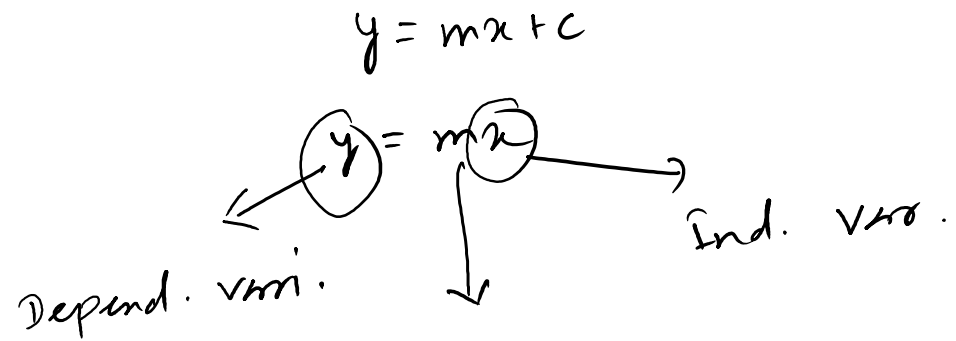

Signal: - physical phenomena \rightarrow carry \rightarrow some information

$$T = 2\pi$$

$$T = 2\pi$$

Slope $m = \tan \alpha = \frac{y}{x}$

$V = IR \Rightarrow \underline{V = RI}$

$V = IR$
 $I = \frac{1}{R} V$

Classification of signals:-

Depending on sensors \rightarrow No of sensors

one channel signal \rightarrow Nose / Ear / sensor
generated by a single source

Multi channel signal

ECG \rightarrow 2 channel

Eight channel ECG

Stereo Stereo \rightarrow

Depending on no. of variables:-

- 1) one-dim. signal , $(V) = (I) \quad (y) = m(x)$
- 2) multi-dim. signal ~~(x)~~ $y = ax^2 + bx + c$

$$(y) = a(x) + b(y) + c(t)$$

motion picture \Rightarrow VDO

Measure of dependant variable:-

1) Analog \rightarrow Measure continuous

2) Discrete

$$S = \frac{V}{L}$$

$$\Rightarrow t = \frac{S}{V}$$

$$\underline{t = nT}$$

$$n=0 \quad t=0$$

$$n=1 \quad t=T$$

$$n=1 \text{ and } n=2$$

why
